

ABSTRACT OF THE DISCLOSURE

15 An encasement system for a display article comprising a transparent top
section, a bottom section, a side section disposed directly adjacent the transparent top
section and bottom section, the side section having an extending arm, the extending
arm having a top segment and a bottom segment and a channel defined there between,
whereby a cavity is defined between the transparent top section, bottom section and
side section for receiving the display article and whereby the channel is in
20 communication with the cavity, an inert gas injected into the cavity through the
channel; and a means for attaching the transparent top section to the side section and
to the bottom section such that the inert gas is sealed inside the cavity between the
transparent top section and bottom section and adjacent the side section..
